

Features

- Integrated 2.4GHz b/g/n Amplifier, LNA, SP3T Switch, and Power Detector Coupler
- Single Supply Voltage 3.0V to 4.8V
- $P_{OUT} = 19\text{dBm}$, 11g, OFDM at <4% EVM; 22dBm 11b ACPR < -33dBc

Applications

- Automotive WiFi
- WiFi Direct
- Automotive Diagnostics
- WiFi Infotainment
- 2.5GHz ISM Band Solutions
- Portable Battery-Powered Equipment

Functional Block Diagram

Product Description

The RFFM5765Q provides a complete integrated solution in a single front end module (FEM) for automotive WiFi applications, 802.11b/g/n, and Bluetooth® systems. The ultra-small form factor and integrated matching greatly reduces the number of external components and layout area in the customer application. This simplifies the total front end solution by reducing the bill of materials, system footprint, and manufacturing cost. The RFFM5765Q integrates a 2.4GHz power amplifier (PA), low noise amplifier (LNA), power detector coupler for improved accuracy, and some filtering for harmonic rejection. The RFFM5765Q is capable of receiving WiFi and Bluetooth simultaneously and is tested in accordance with AEC-Q100 standard. The device is provided in a 3mm x 3mm x 0.5mm, 16-pin package. This module meets or exceeds the RF front end needs of IEEE 802.11b/g/n WiFi RF systems.

Ordering Information

RFFM5765QSQ	Standard 25 piece bag
RFFM5765QSR	Standard 100 piece bag
RFFM5765QTR7	Standard 2500 piece reel (13")
RFFM5765QPCBA-410	Fully Assembled Evaluation Board with 5-piece Sample

Absolute Maximum Ratings

Parameter	Rating	Unit
DC Supply Voltage (Continuous with No Damage)	6.0	V
DC Supply Current	700	mA
Case Operating Temperature	-40 to +85	°C
Storage Temperature	-40 to +150	°C
Maximum Tx Input Power into 50Ω Load for 11b/g/n (No Damage)	+5	dBm
Maximum Rx Input Power (No Damage)	+5	dBm
Moisture Sensitivity	MSL2	

**Caution!** ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

Input P1dB	27	30		dB	BT Mode, over temp, C_BT = 3.3V to 3.6V
Bluetooth Port Return Loss	8.5			dB	Switch in Bluetooth Mode
	6			dB	Switch in WiFi Rx/Bluetooth Mode
Other Requirements					
Antenna Port Impedance					
Output		50		Ω	
Return Loss		10		dB	
Isolation					
Antenna to Receive	20			dB	In BT Mode (measured from ANT to Rx port)
Antenna to Bluetooth	20			dB	In Tx Mode (measured from ANT to BT port)
Antenna to Receive	20			dB	In Tx Mode (measured from ANT to Rx port)
Switch Control Voltage					C_RX, C_BT, and C_BW Rx control lines
Low		0	0.2	V	Switch is in the low state (L)
High	1.7	3.3	3.6	V	Switch is in the high state (H)

Parameter	Specification			Unit	Condition
	Min.	Typ.	Max.		
Other Requirements (continued)					
Switch Control Current		2	10	μA	Per control line (C_BT, C_BWRX)
C_RX Current		100	150	μA	Over V _{CC} , Frequency and Temperature.
Switch Control Speed			200	ns	
Switch P1dB		28		dBm	
ESD					
Human Body Model	500			V	EIA/JESD22-114A RF pins
	1000			V	EIA/JESD22-114A DC pins
Charge Device Model	500			V	JESD22-C101C all pins

Note 1: The PA module must operate with gated bias voltage input at 1% to 99% duty cycle.

Note 3: Values to be agreed to upon characterization data review: current, gain, return loss, detector sensitivity and output power.

Note 4: The output power for channels 1 and 11 may be reduced to meet FCC restricted band requirements.

Switch Control Logic

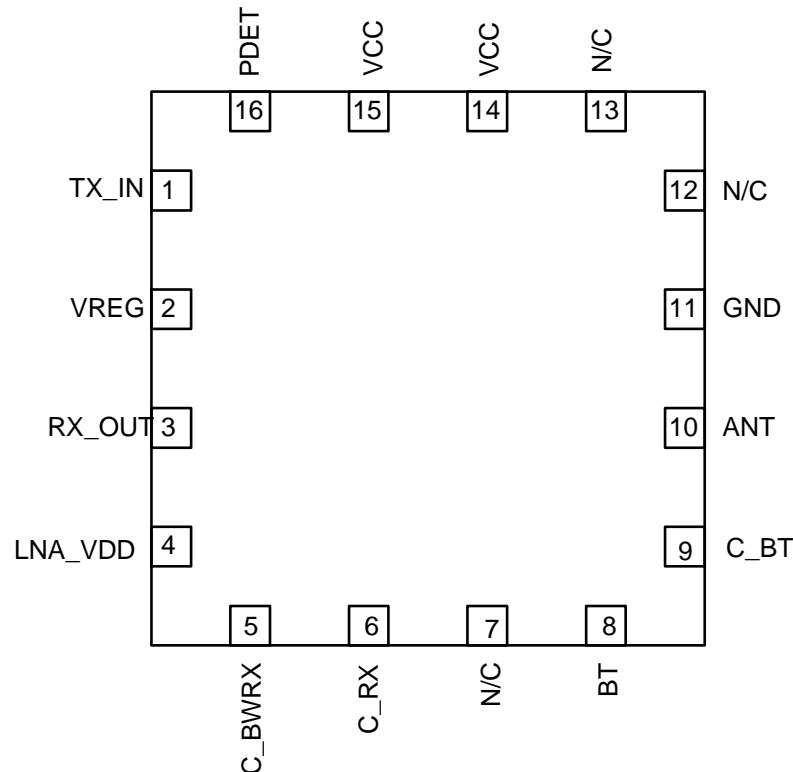

Mode	VREG	C_RX	C_BT	C_BWRX
Standby	L	L	L	L
WiFi Tx	H	L	L	L
WiFi Rx	L	H	L	L
WiFi Rx/BT*	L	H	L	H
BT Rx	L	L	H	L
BT Tx	L	L	H	L

*The FEM can be placed in receive WiFi and Bluetooth modes simultaneously with increased insertion loss.

Pin Names and Descriptions

Pin	Name	Description
1	TX_IN	RF input for the PA. Input is matched to 50Ω and DC block is provided internally.
2	VREG	Supply voltage for the bias control circuit, and the Tx control port of the SP3T which is also tied to this pin. An external bypass capacitor may be needed on the V _{REG} line for decoupling purposes.
3	RX_OUT	Receive port output. Internally matched to 50Ω. DC block provided internally.
4	LNA_VDD	Supply voltage for the LNA.
5	C_BWRX	SPST switch control pin. (Simultaneous WiFi and BT receive.) See truth table for proper level.
6	C_RX	Receive switch control pin. See switch truth table for proper level.
7	N/C	No connect.
8	BT	RF bidirectional port for Bluetooth. Input is matched to 50Ω and DC block is provided internally.
9	C_BT	Bluetooth switch control pin. See truth table for proper level.
10	ANT	Port matched to 50Ω and is DC blocked internally.
11	GND	Ground.
12	N/C	No connect.
13	N/C	No connect.
14	VCC	Supply voltage for the PA.
15	VCC	Supply voltage for the PA.
16	PDET	Power detector voltage for Tx section. PDET voltage varies with output power. May need external decoupling capacitor for noise bypassing. May need external circuitry to bring output voltage to desired level.

RFFM5765Q PCB Footprint and Stencil Recommendations

Application Schematic

Theory of Operation

The RFFM5765Q front end module (FEM) is designed for automotive WiFi applications in the 2.5GHz ISM band. It can be applied in many portable applications such as handsets, portable media players, and portable battery power equipment. This highly integrated module can be connected directly to the battery without additional voltage regulators.

WiFi Transmit Mode

The RFFM5765Q requires a single positive supply (V_{CC}), a positive supply for switch controls, and a regulated supply for the V_{REG} to maintain nominal bias current. The RFFM5765Q transmit path has a typical gain of 30dB from 2.4GHz to 2.5GHz, and delivers 19dBm typical output power under 54Mbps OFDM modulation and 22dBm under 1Mbps 11b modulation. The RFFM5765Q contains basic filter components to produce a bandpass response for the transmit path. Due to space constraints inside the module, filtering is limited to a few resonant poles and additional filters may be required depending upon the end-user's application. While in transmit mode, the active components are the power amplifier (PA) and the Tx branch of the SP3T switch. Refer to the logic control table for proper settings.

Tx Biasing Instructions

- Connect the Tx input (pin-1) to a signal generator and a spectrum analyzer at the antenna output (pin-10)
- Set V_{CC} to 3.3V with V_{REG} set to 0V
- Turn V_{REG} ON and set voltage to 3.1V. V_{REG} controls the current drawn by the PA and it should quickly reach a quiescent current of approximately $110\text{mA} \pm 20\text{mA}$. Care must be exercised not to exceed 3.5V on the V_{REG} pin or the part may be damaged.
- Control bias to the transmit branch of the SP3T switch is tied directly to V_{REG}
- The SP3T controls for the off branches (C_RX and C_BT) must be set to a logic "low" (0.2V max) or grounded. In the event that one of these branches is left floating or in a logic "high" the performance of the PA will degrade significantly. Likewise, unused RF ports must be terminated in 50Ω to simulate actual system conditions and prevent RF signals from coupling back to the PA.
- Turn RF ON

WiFi Receive Mode

Within the frequency band of operation 2.4GHz to 2.5GHz, the RFFM5765Q WiFi receive path has a typical gain of 18dB and a NF of 2.1dB with about 10mA of current. In Rx mode, only the Rx branch of the SP3T and the LNA are active. Refer to the logic control table for proper settings.

Rx Biasing Instructions

- Connect the Rx input (ANT/pin-10) to a signal generator and a spectrum analyzer at the Rx output (pin-3). A VNA may be used as well.
- Turn the LNA bias ON (pin-4) and set the voltage to 3.3V.
- Set C_RX (pin-6) high. This turns ON the receive branch of the SP3T.
- The SP3T controls for the off branches (V_{REG} and C_BT) must be set to a logic "low" (0.2V max) or grounded. In the event that one of these branches is left floating or in a logic "high" the performance will degrade. It is recommended to terminate unused RF ports in 50Ω .
- Set the control bias for the SPST switch (C_BWRX/pin-5) "low" during WiFi Rx only mode.
- Turn RF ON.

WiFi and Bluetooth Receive (Simultaneous Mode)

The RFFM5765Q WiFi and Bluetooth receive circuits were specifically designed to address issues of simultaneous operation. In this mode both signals can be received at the same time when the C_BWRX (pin-5) is set high. The typical gain for each RF path is approximately 13dB and a NF of 3dB. During simultaneous mode the active components are the LNA, the SPST switch, and only the Rx branch of the SP3T. Refer to the logic control table for proper settings.

Simultaneous Mode Biasing Instructions

- Connect the RF input (ANT/pin-10) to a signal generator and a spectrum analyzer at the Rx (pin-3) and BT (pin-8) RF ports. A multiport VNA may be used as well.
- Turn the LNA bias ON (pin-4) and set the voltage to 3.3V.
- Set C_RX and C_BWRX high. This turns ON the receive branch of the SP3T and the SPST switch.
- The SP3T controls for the off branches (V_{REG} and C_BT) must be set to a logic “low” (0.2V max) or grounded. In the event that one of these branches is left floating or in a logic “high” the performance will degrade. It is recommended to terminate unused RF Ports in 50Ω.
- Turn RF ON.

Bluetooth Mode

The RFFM5765Q Bluetooth only mode is implemented through the SP3T switch by setting C_BT “high.” Typical insertion loss is about 1.2dB.

Bluetooth Biasing Instructions

- Connect the RF input (ANT/pin-10) to a signal generator and a spectrum analyzer at the BT RF port. A VNA may be used in place of the Sig Gen and SA.
- Set C_BT (pin-9) “high.” This turns the Bluetooth branch of the SP3T switch ON.
- The SP3T controls for the off branches (V_{REG} and C_RX) must be set to a logic “low” (0.2V max) or grounded. Do not leave floating.
- Terminate unused RF Ports in 50Ω.
- Turn RF ON.

Application Circuit and Layout Recommendations

The RFFM5765Q integrates the matching networks and DC blocking capacitors for all RF ports. This greatly reduces the number of external components and layout area needed to implement this FEM. Typically only a total of four external components are required to achieve nominal performance. However, depending on board layout and the many noise signals that could potentially couple to the RFFM5765Q, additional bypassing capacitors may be required to properly filter out unwanted signals that might degrade performance.

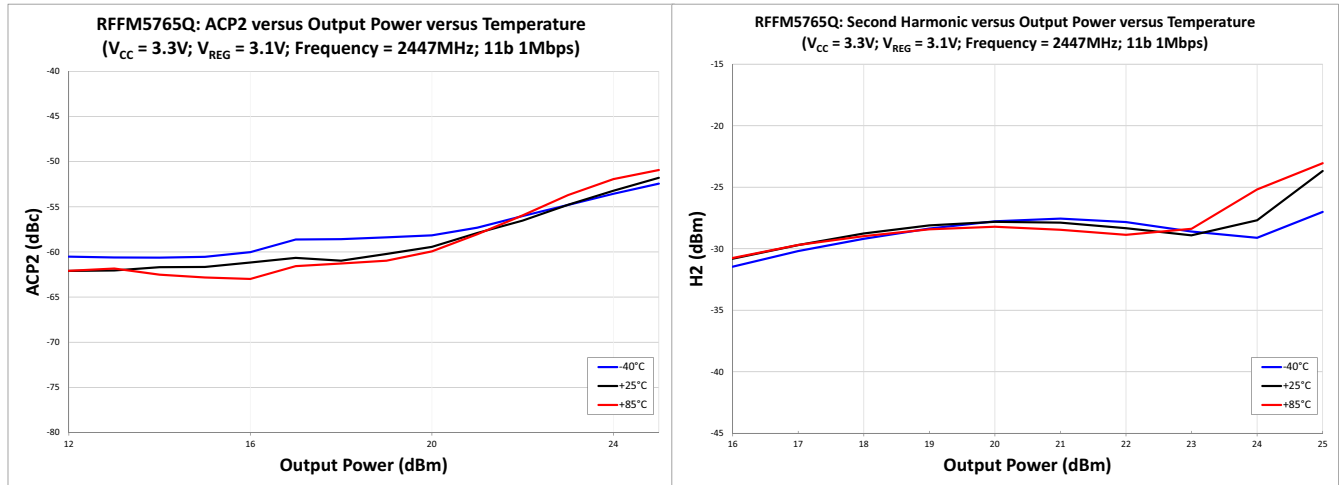

The LNA bias components consist of an inductor and a decoupling capacitor. The inductor value is critical to optimize NF and return loss at the Rx output. For best performance and trade off between critical parameters such as NF, Gain, and IP3, the total inductance including board trace should be approximately 1.2nH. The 5.6kΩ series resistor for the Bluetooth control line helps to prevent unwanted signal from coupling to this pin. The resistor should be placed as close as possible to the package pin. The last component needed in the application circuit is a low frequency bypass capacitor on the V_{CC} line. In general, it is good RF practice to have proper decoupling of supply lines to filter out noise. Occasionally, depending on the level of coupling or parasitics of the board, a high frequency bypass capacitor must be added as well.

In order to optimize performance for both the transmit and receive paths, a good layout design must be implemented. In addition to designing 50Ω RF lines, proper grounding along the RF traces and on the FEM ground slug must be exercised. This will minimize coupling and provide good thermal dissipation when the PA is operating at high power. For reference, the RFMD evaluation board uses 9 thermal ground vias (hole/capture pad 12/22mil) on the ground slug. Additionally, if space permitted, V_{CC} and control lines must be isolated from each other with ground vias in between them. RFMD evaluation board gerbers are available upon request.
