

CMD233

2- 20 GHz Distributed Low Noise Amplifier

Features

- ▶ Wide bandwidth
- ▶ Single positive supply voltage
- ▶ Low noise figure
- ▶ Small die size

Description

The CMD233 is a wideband GaAs MMIC low noise amplifier ideally suited for military, space and communications systems where small size and low noise figure are needed over a wide bandwidth. At 10 GHz the device delivers greater than 9 dB of gain with a corresponding noise figure of 4.5 dB and an output 1 dB compression point of +20.5 dBm. The CMD233 is a 50 ohm matched design which eliminates the need for external DC blocks and RF port matching. The CMD233 offers full passivation for increased reliability and moisture protection.

Applications

- ▶ Wideband communication systems
- ▶ Point-to-point radios
- ▶ Military and space
- ▶ Test Instrumentation
- ▶ CMM4000 replacement

Die Outline (all dimensions in microns)

Notes:

1. No connection required for unlabeled pads
2. Backside is RF and DC ground
3. Backside and bond pad metal: Gold
4. Die is 100 microns thick
5. DC bond pads are 80 microns square
6. RF bond pads are 80 x 150 microns

Applications Information

Assembly Guidelines

The backside of the CMD233 is RF ground. Die attach may be accomplished with either electrically and thermally conductive epoxy or eutectic attach. Standard assembly procedures should be followed for high frequency devices. The top surface of the semiconductor should be made planar to the adjacent RF transmission lines, and the RF decoupling capacitors placed in close proximity to the DC connections on chip.

RF connections should be made as short as possible to reduce the inductive effect of the bond wire. Use of a 0.8 mil thermosonic wedge bonding is highly recommended as the loop height will be minimized. The RF input and output require a single bond wire as shown.

The semiconductor is 100 μm thick and should be handled by the sides of the die or with a custom collet. Do not make contact directly with the die surface as this will damage the monolithic circuitry. Handle with care.

Assembly Diagram

GaAs MMIC devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.

2-20 GHz Distributed Low Noise Amplifier

Applications Information

Biasing and Operation

The CMD233 is biased with a single positive drain supply. Performance is optimized when the drain voltage is set to +5.0 V.

Turn ON procedure:

1. Apply drain voltage V_{dd} and set to +5 V

Turn OFF procedure:

1. Turn off drain voltage V_{dd}

RF power can be applied at any time.
