

BROADBAND DISTRIBUTED AMPLIFIER

ADM-0026-5915SM

The ADM-0026-5915SM is a broadband, efficient GaAs PHEMT distributed amplifier in a 4mm QFN surface mount package. The ADM-0026-5915SM is designed to provide LO drive for 'L', 'M', 'I', and 'H' level mixers, with 13.5 dB typical gain and 17 dBm typical saturated output power for only 125 mA of current. The amplifier can be biased with internal circuitry, or with an external bias network for lower voltage and single supply operation. Additional applications include amplification of clock signals and other general purpose driver applications in electronic warfare and test and measurement.

Features

- Optimized for use as a double balanced mixer buffer amplifier
- Suitable for driving L, M, and I diode mixers
- Optional Positive Only Bias or Internal Bias Operation
- +17 dBm typical saturated output power
- Broadband 50 Ω Matching
- Unconditionally Stable

Electrical Specifications - Specifications measured in a 50-Ohm system.

Parameter	Frequency (GHz)	Min	Typ	Max
Input for Saturated Output (dBm)	DC to 26.5	+5	+10	+12
Output 1 dB Compression (dBm)			+15	
Saturated Output Power with negative bias (dBm)			+17	
Small Signal Gain with negative bias (dB)			13.5	
Return Loss (dB)			17	
Noise Figure (dB)			5.5	
Third Order Output Intercept Point (dBm)			25	
Bias Requirements, Internal (mA) Vd: +10.0 to +12.0 / Vg: -0.25 Volts			120	
Bias Requirements, External (mA) Vd: +5.0 to +7.0 / Vg: -0.25 Volts Vd: +5.0 to +7.0 / Vg: 0 Volts			125 175	

Part Number Options

Model Number	Description
ADM-0026-5915SM ¹	Surface Mount 4mm QFN
EVAL-ADM-5915SM	Connectorized Evaluation Fixture

¹ Note: For port locations and I/O designations, refer to the drawings on pages 2, 7, 10, and 11 of this document.

GaAs MMIC devices are susceptible to Electrostatic Discharge. Use proper ESD precautions when handling these items.

Page 2

Frequency DC to 26.5 GHz

Functional Diagram and Application Circuit – External Positive Bias (Pin 16 Output with Bias Tee)

Biasing and Operation

RF In / RF Out – Input and output signals should be connected by 50 ohm microstrip or coplanar traces to well matched 50 ohm sources and loads. DC blocking capacitors or bias tees are required.

Vg – Negative gate voltage is optional to improve lifetime of the amplifier and reduce current consumption. Harmonic generation is also significantly affected by the negative gate voltage level. The amplifier is designed for optimal performance when the negative gate voltage is tuned such that the *positive* bias supply is 112 mA. It may be supplied through pin 11 or through the RF input on pin 4.

Vd – Bias supply supplied to Vd through pin 16 should be voltage limited below 9 V and current limited below 200 mA at all times. The operational bias voltage should be between 5 V and 7 V for full gain, efficiency, and linearity. In general gain, linearity, and output power will increase marginally with increased voltage from 5 to 7 V.

Optional Bias Circuitry – The resistor and capacitor on the Vd and Vg lines (pads 21, 23, and 11) prevent low frequency oscillation. These components are not required in bias circuits with sufficient low frequency loss. Designers should experiment to determine if they are necessary.

DC/RF Ground – The ground paddle of the QFN should be connected to a low noise RF and DC ground with very low electrical and thermal resistance for high frequency operation and thermal heat sinking.

Functional Diagram and Application Circuit – Internal Positive Bias Tee (Pin 21)

Biasing and Operation

RF In / RF Out – Input and output signals should be connected by 50 ohm microstrip or coplanar traces to well matched 50 ohm sources and loads. DC blocking capacitors are required.

Vg – Recommended bias on this pin is -0.1 to -0.3 Volts. Harmonic generation is also significantly affected by the negative gate voltage level. The amplifier is designed for optimal performance when the negative gate voltage is tuned such that the *positive* bias supply is 112 mA. It may be supplied through pin 11 or through the RF input on pin 4.

Vd - Bias supply on Vd should be voltage limited below 13 V and current limited below 200 mA at all times. The operational bias voltage should be between 10 V and 12 V for full gain, efficiency, and linearity. In general gain, linearity, and output power will increase marginally with increased voltage from 10 V to 12 V. When the internal positive bias tee is used, pin 23 is left DC and RF open.

Optional Bias Circuitry – The resistor and capacitor on the Vd and Vg lines (pads 21, 23, and 11) prevent low frequency oscillation. These components are not required in bias circuits with sufficient low frequency loss. Designers should experiment to determine if they are necessary.

DC/RF Ground – The ground paddle of the QFN should be connected to a low noise RF and DC ground with very low electrical and thermal resistance for high frequency operation and thermal heat sinking.

Pin Descriptions			
Pin Number	Function	Description	Interface Schematic
1-3, 5-10, 12-15,17-20, 22, 24	NC	These pins are not connected internally. Datasheet performance is tested with NC pins grounded.	
4	RF in	This pin is DC coupled and matched to 50 Ω .	
11	Vg	Gate control for the amplifier. External decoupling resistor/capacitor is required.	
16	RF out	This pad is DC coupled and matched to 50 Ω .	
21	Vd	Power supply voltage for the amplifier. External decoupling resistor/capacitor is required.	
23	Vd2	This pin is left open for Internal Vd Bias. This pin is connected to Pin 21 (Vd) for external bias (pin 16 with bias tee).	
Paddle	GND	Ground pad should be connected to RF/DC ground with low electrical and thermal resistance.	

Absolute Maximum Ratings	
Parameter	Maximum Rating
Positive Bias Voltage – External Bias Tee	9 V
Positive Bias Bias Voltage – Internal Bias Tee	13 V
Positive Bias Current	200 mA
Negative Bias Voltage	-2 V
Negative Bias Current	2 mA
RF Input Power	+15 dBm
Power Dissipation	875 mW
ESD (Human Body Model)	Class 0
Operating Temperature	-55°C to +85°C
Storage Temperature	-65°C to +150°C

Evaluation Board

The evaluation module follows Marki standard assembly and evaluation procedures to give optimal performance for datasheet characterization. Actual QFN performance will depend on substrate material, bypass capacitors, resistors, connectors, quality of bias current/voltage source, and assembly process.

Evaluation Board Bill of Materials	
Item	Description/Part Number
Connectors	Southwest 214-510SF
Bias Pins	Kovar
